How can I use this document?

This is the Subject Benchmark Statement for Economics. It defines the academic standards that can be expected of a graduate, in terms of what they might know, do and understand at the end of their studies, and describe the nature of the subject.

The [UK Quality Code for Higher Education](#) (Quality Code) sets out the Expectations and Core practices that all providers of UK higher education are required to meet. Providers in Scotland, Wales and Northern Ireland must also meet the Common practices in the Quality Code.

The Quality Assurance Agency for Higher Education (QAA) has also published a set of [Advice and Guidance](#), divided into 12 themes, and a number of other resources that support the mandatory part of the Quality Code. Subject Benchmark Statements sit alongside these resources to help providers develop courses and refine curricula but are not part of the regulated requirements for higher education providers in the UK.

This Statement is intended to support you if you are:

- involved in the design, delivery and review of courses of study in economics or related subjects
- a prospective student thinking about studying this subject, or a current student of the subject, to find out what may be involved
- an employer, to find out about the knowledge and skills generally expected of a graduate this subject.

Subject Benchmark Statements provide general guidance for articulating the learning outcomes associated with the course but are not intended to represent a national curriculum in a subject or to prescribe set approaches to teaching, learning or assessment. Instead, they allow for flexibility and innovation in course design within a framework agreed by the subject community.

It may be helpful to refer to the relevant Advice and Guidance when using this Statement.

Explanations of unfamiliar terms used in this Subject Benchmark Statement can be found in QAA's [Glossary](#).

About the Statement

This Subject Benchmark Statement refers to bachelor's degrees with honours in economics.¹

It has been produced by a group of subject specialists drawn from, and acting on behalf of, the subject community. The process is facilitated by QAA, as is the full consultation with the wider academic community and stakeholder groups each Statement goes through.

In order to ensure the continuing currency of Subject Benchmark Statements, QAA initiates regular reviews of their content, five years after first publication, and every seven years subsequently, or in response to significant changes in the discipline.

Relationship to legislation

Higher education providers are responsible for meeting the requirements of legislation and any other regulatory requirements placed upon them, for example by funding bodies. This Statement does not interpret legislation, nor does it incorporate statutory or regulatory requirements. The responsibility for academic standards remains with the higher education provider who awards the degree.

Higher education providers may need to consider other reference points in addition to this Statement in designing, delivering and reviewing courses. These may include requirements set out by professional, statutory and regulatory bodies (PSRBs) and industry or employer expectations.

Sources of information about other requirements and examples of guidance and good practice are signposted within the Subject Benchmark Statement where appropriate. Individual higher education providers will decide how they use this information.

Summary of changes from the previous Subject Benchmark Statement (2015)

This version of the Statement forms its fourth edition, following initial publication of the Subject Benchmark Statement in 2000 and review and revision in 2006 and 2015.

This latest version of the Statement is the consequence of the revision to the [UK Quality Code for Higher Education](#) which was published in 2018. It has been revised to update references to the Quality Code and other minor changes within the sector. Changes have been made by QAA and confirmed by a member of the most recent review group.

There have been minor revisions to the subject-specific content, namely:

- paragraph 5.5, viii: text updated from:

Markets and market failure - economists understand that perfectly functioning markets between buyers and sellers may deliver the maximum welfare for a society, but that there are numerous cases where the actions of an economic actor or actors confers un-priced benefits or costs on another or on the environment. Students learn to recognise these market externalities and to evaluate how policy and or private bargaining can achieve improved allocations.

¹ Bachelor's degrees are at level 6 in *The Framework for Higher Education Qualifications in England, Wales and Northern Ireland* and level 10 in *The Framework for Qualifications of Higher Education Institutions in Scotland*, as published in [The Frameworks for Higher Education Qualifications of UK Degree-Awarding Bodies](#)

to:

Markets and market failure - economists understand that price-taking markets between buyers and sellers may deliver the maximum welfare to market participants, but such markets are rare. In most cases, the actions of an economic actor or actors confer un-priced benefits or costs on another or on the environment. Students learn to recognise such external effects and to evaluate how policy and or private bargaining can achieve improved allocations.

1 Introduction

1.1 This document sets out benchmark standards for honours degrees in economics. It defines the distinctive nature of the subject, the aims of a typical degree course, the subject knowledge and skills of an economist, methods of learning and assessment and finally a description of two benchmark standards, at threshold and typical levels.

2 Nature and context of economics

2.1 Economics is the study of the factors that influence income, wealth and well-being. From this it seeks to inform the design and implementation of economic policy. Its aim is to analyse and understand the allocation, distribution and utilisation of resources and the consequences for economic and social well-being. Economics is concerned with such phenomena in the past and present and how they may evolve in the future.

2.2 Studying economics requires an understanding of how resources are used and how economic entities, such as households, firms and governments behave and interact. This understanding is required at both the individual (micro) and the aggregate (macro) level. The analysis is both static (dealing with, for example, levels of output, employment, income and trade) and dynamic (concerned with, for example, innovation, technical progress, economic growth and the distribution of income, business cycles, financial stability and instability, and sustainable development). Various interpretations of commonly observed economic phenomena exist, and hence explanations may be contested. It is therefore important that economic phenomena are studied in their relevant historical, political, institutional, international, social and environmental contexts, including business, and that theories are evidence-based, using quantitative and qualitative data analysis.

2.3 Economics is a major social science which draws on and influences other social sciences. It also links with other subject areas such as ethics, finance, geography, history, international relations, law, philosophy and psychology. It uses and interacts with mathematical and statistical methods and sciences such as environmental science, biology and medicine. As economics is integral to understanding business behaviour, strategy and corporate performance, it is also one of the core disciplines informing the study of business and management.

2.4 Recognition of these interrelationships and the increasing number of students who are choosing to study economics jointly with other subjects have led to new and imaginative degree courses. Their design has been influenced by the appreciation that a training that includes an understanding of economics concepts provides significant employment opportunities in a variety of careers in addition to working as a professional economist.

2.5 This points to certain key intellectual features that characterise the approach of economists. First there is the ability to abstract and simplify in order to identify and model the essence of a problem. Second is the ability to analyse and reason - both deductively and inductively. Third is the ability to gather evidence and to assimilate, structure, analyse and evaluate qualitative and quantitative data. Fourth is the ability to communicate results concisely to a variety of audiences, including those with no training in economics. Fifth is the ability to think critically about the limits of one's analysis in a broader socioeconomic context. Sixth is the ability to draw economic policy inferences, to recognise the potential constraints in their implementation and to evaluate policy outcomes in the light of stated policy objectives.

3 The aims of degree courses in economics

3.1 Given these defining features, the main aims of a degree course in economics, or including economics as a major component, are to:

- provide education and training in economic concepts, theories, ideas and tools, and their application, appropriate to the type of degree concerned: single honours, joint honours or combined studies
- stimulate students intellectually through the study of economics and to lead them to appreciate its application to a range of problems and its relevance in a variety of contexts
- provide a firm foundation of knowledge about the workings of economic systems and to develop the relevant skills for the constructive use of that knowledge in a range of settings
- foster an understanding of alternative approaches to the analysis of economic phenomena
- develop in students the ability to apply the knowledge and skills they have acquired to the solution of specific theoretical and applied problems in economics
- equip students with appropriate tools of analysis to tackle issues and problems of economic policy
- develop in students, through the study of economics, a range of generic skills that will be of value in employment and self-employment
- provide students with analytical skills and an ability to develop simplifying frameworks for studying the real world. They should be able to appreciate what would be appropriate levels of abstraction in order to study a range of economic issues and the specific assumptions that guide the criteria for simplification
- provide students with the knowledge and skills base from which they can proceed to further studies in economics, related areas or in multidisciplinary areas that involve economics
- generate in students an appreciation of the economic and welfare dimensions of wider social, political and environmental issues
- develop in students an ability to interpret real-world economic events and critically assess a range of types of evidence.

4 Subject knowledge and understanding

4.1 Graduates of a single honours degree in economics usually learn about the following.

- i Economic concepts, principles and tools, the understanding of which might be verbal, graphical and/or mathematical. These concepts, tools and principles play a key role in reasoning. They address the microeconomic issues of decision and choice, the production and exchange of goods, the pricing and use of inputs, the interdependency of markets, the relationships between principals and agents, and economic welfare. They also include the macroeconomic issues of employment, national income, the balance of payments, the distribution of income, economic growth, financial and business cycles, and the role of money creation, banking and the financial system in the economy, society and the environment.
- ii Economic policy at both the microeconomic and macroeconomic levels. In all these, students show an understanding of analytical methods and model-based argument and understand different methodological approaches and their strengths and limitations.
- iii Relevant quantitative methods and computing techniques. These include appropriate mathematical and statistical methods, including econometrics. Students have exposure to the use of such techniques on actual economic, financial or social data, using suitable statistical or econometric software.
- iv The nature, sources and uses of both quantitative and qualitative data and an ability to select and apply appropriate methods that economists might use to analyse such data.
- v The applications of economics. Students discover how to apply relevant economic principles and reasoning to a variety of applied topics. They are also aware of how economics can be applied to design, guide and interpret commercial, economic, social and environmental policy. As part of this, they have the ability to discuss and analyse government policy and to evaluate the performance of the UK and other economies, past and present.

4.2 It is recognised that, in both single honours degrees and in many degrees that involve a substantial amount of economics, content is adapted to suit the nature and objectives of the degree course. In degrees that are not single honours economics, not all the elements in paragraph 4.1 may be covered. It is also recognised that the forms of analysis chosen may differ and may be tailored to best serve the skills that students bring with them into their degree course. It is neither the function nor the objective of this Subject Benchmark Statement to prescribe what these forms of analysis might be; this is a matter for institutional choice and decision.

4.3 The attainments of an economics student generally include, but may not be limited to the following.

- i A critical understanding of analytical methods, both theory and model-based.
- ii An appreciation of the history and development of economic ideas and the differing methods of analysis that have been and are used by economists.
- iii An ability to apply economic reasoning to applied topics.
- iv An ability to relate differences in economic policy recommendations to differences in the theoretical and empirical features of economic analysis that underlie such recommendations.

- v An ability to discuss, analyse and evaluate government policy and to assess the performance of the UK and other economies and of the global economy.
- vi An understanding of verbal, graphical, mathematical and econometric representation of economic ideas and analysis, including the relationship between them. Appropriate techniques to enable manipulation, treatment and interpretation of the relevant quantitative and qualitative data are also relevant.
- vi An ability to articulate, communicate and present economic arguments to both specialist and non-specialist audiences.

5 Subject-specific skills and other skills

5.1 Some of the attributes that a graduate in economics possesses are generic and not specific to the study of the subject. Their enhancement would be part of any degree course. These would include general intellectual skills such as literary and information-processing skills, as well as interpersonal skills, such as communication. Economics degree courses, therefore, provide a learning environment that facilitates and encourages the development and use of such skills.

5.2 In particular, employers of economists also value the ability to produce reports and conclusions that are well evidenced by empirical analysis; the ability to communicate technical analysis and results to various non-economist audiences; knowledge of economic history and its context (social, technical and political), pluralistic perspectives and interdisciplinary synthesis, to inform an application of critical judgement in evaluating context, proportionality and awareness of limitations.

5.3 There are three elements in the training of an economics graduate that provide them with a coherent framework of thinking that is readily transferable and applicable to decision-making in a wide range of areas. These elements are a set of subject-specific skills; a conceptual framework that offers a guide to good decision-making; and the general, but crucial, skill of numeracy.

Subject-specific skills

5.4 Economics graduates possess subject-specific but highly transferable, rigorous skills. This transferability is evidenced by the wide range of careers into which graduates in economics move. The development of these skills is particularly emphasised in the course of an undergraduate degree through the study of economic principles and economic methods. These skills may be summarised as follows.

- i Abstraction - from the study of economic principles and models, students see how one can abstract the essential features of complex systems and provide a useable framework for evaluation and assessment of the effects of policy or other exogenous events. Through this, students acquire proficiency in how to simplify while still retaining relevance. This is an approach that they can then apply in other contexts, thereby becoming more effective problem-solvers and decision-makers.
- ii Analysis, deduction and induction - economic reasoning can be highly deductive, and logical analysis is applied to assumption-based models. Inductive reasoning is important. The development of such analytical skills enhances students' problem-solving and decision-making ability.
- iii Quantification, evaluation and design - data, their sources, and their effective organisation, presentation and analysis, are important in economics. Students have some understanding of the principal sources of economic information and data relevant to industry, commerce, society and government, and have had practice in organising it and presenting it informatively and assessing its reliability. This skill is important at all stages in the decision-making process.
- iv Framing - through the study of economics, a student learns how to decide what should be taken as given or fixed for the purposes of setting up and solving a problem; for example, what the important 'parameters' are in constraining the solution to the problem. Learning to think about how and why these parameters might change encourages a student to place the economic problem in its broader

social and political context. This 'framing' skill is important in determining the decision-maker's ability to implement the solutions to problems.

Transferable application of economic concepts

5.5 From learning economic principles, the typical student acquires a facility with some key concepts that are present in most of the decision problems that they are likely to face subsequently in their careers. These include the following.

- i Opportunity cost and scarcity - a problem-solver or decision-maker must routinely ask 'what would have to be given up if...' where the answer does not always involve a simply calculated financial cost. It is often the case that actions are proposed that fail to recognise foregone alternatives. Opportunity cost allows economists to think about the costs in terms of all resources, including time. There are many examples of economic policies which enhance efficiency yet reduce equity/sustainability and vice versa. There are also many examples where gains in one time period involve costs in other time periods. All of these examples encourage an appreciation of inevitable trade-offs.
- ii Incentives and psychological biases - economists are trained to recognise and evaluate the incentives implied by particular rules, and how to establish sets of rules that actually lead people to react in ways that give rise to intended and unintended outcomes. The ability to think logically about these issues is essential in the effective design of both policy and strategy.
- iii Strategic thinking - economists learn the importance of strategic thinking, and the roles of opportunities, strategies, outcomes, information and motivation in the analysis of strategic actions, including conflict, bargaining and negotiation.
- iv Expectations and surprises - economists learn that behaviour partly depends on experience and partly on peoples' perceptions of what is expected to happen. Therefore, behaviour may change when unanticipated events occur. Effective decision-making requires the skill of reacting in a context where people's behaviour is based on expectations that may be confounded by subsequent surprises. Students in economics are exposed to these issues and this enhances their potential effectiveness as decision-makers.
- v Marginal considerations - economists are trained to recognise that important decisions often relate to small variations in key variables and parameters. An action is worth undertaking if the additional benefit that accrues is greater than the additional cost (including social and environmental cost) incurred. Students in economics are aware of the importance of the margin relative to the average.
- vi Equilibrium, stability and dynamics - the concept of equilibrium, when a system is in a state of rest or changing at a constant rate, and the subsequent dynamic adjustment to both internal and external shocks, are fundamental concepts in economics. Economists appreciate the interdependence between economic phenomena and how disturbances can accumulate or die away. An ability to see beyond the immediate effects is a crucial insight that economists bring to analysing the effects of both deliberate decisions and unexpected shocks.
- vii Mutual gains and conflicts of interest - economists are aware that the outcome of an economic interaction reflects opportunities for mutual gains from exchange as well as conflicts of interest. Students learn to evaluate such outcomes in terms of efficiency (unexploited mutual gains), fairness and sustainability.

- viii Markets and market failure - economists understand that price-taking markets between buyers and sellers may deliver the maximum welfare to market participants, but such markets are rare. In most cases, the actions of an economic actor or actors confer un-priced benefits or costs on another or on the environment. Students learn to recognise such external effects and to evaluate how policy and/or private bargaining can achieve improved allocations.

Numeracy

5.6 Economists frequently use information that is presented in some numerical form, and students should be appropriately trained in this regard. Numeracy, statistical and computing skills are necessary to handle numerical information. Presentation skills are needed to communicate such quantitative information in usable ways, and particularly to give critical and coherent summary representations of data that cannot be readily absorbed raw. As well as formal manipulative and presentation skills required to deal with statistical data, economists learn not to be misled by numbers or the selective use of data. They question whether the numbers represent what they claim, they understand statistical significance and they are aware of at least some of the difficulties in sampling a population. In addition, with some understanding of econometrics, they recognise that conclusions drawn from data might be ambiguous.

6 Teaching, learning and assessment

6.1 A course of study in economics is designed to encourage the acquisition of subject knowledge, understanding and skills with increasing critical facility and independence as the course progresses. To this end, learning is organised and supported to foster active learning, for example by using a range of assessment methods. A variety of approaches to managing the learning process may be adopted to achieve this, including lectures, seminars, tutorials, workshops, peer teaching and learning, project-based learning, experiments, games, technology-enabled learning and the use of practitioners.

6.2 These approaches to the learning process are supported by appropriate resources, including access to economic databases, such as the Office of National Statistics database, information technology-based resources, and written materials. The use of such resources encourages active learning and the ability to select and make appropriate use of supporting evidence.

6.3 Problem-solving skills and higher-order skills of reasoning and analysis are encouraged through teaching and assessment strategies that require students to use these resources in active ways. Students are assisted and supported in their endeavours to analyse and explore information and to draw appropriate policy conclusions.

6.4 In assessing students' work, some or all of the following criteria may be adopted.

- How far have students focused on the questions asked and/or identified key problems?
- How well have students chosen the arguments, the relevant theory or model, to relate to the area specified or question asked?
- How good is the quality of explanation?
- How well have students demonstrated consistency, coherence and purposeful analysis?
- How successfully have students used evidence and knowledge of historical, political, institutional, international, social and environmental contexts?
- How well have students collected, processed, analysed and interpreted relevant data?
- What is the extent and quality of critical evaluation?
- How well have students demonstrated knowledge of relevant literature?

7 Benchmark standards

7.1 The benchmark levels are for both a single honours degree in economics and for those degrees where economics is a major component. Students following degrees where economics is a minor component are not expected to attain all of these benchmarks. Students achieving the typical standard would also achieve the threshold.

The threshold level

7.2 A graduate in economics who has attained the threshold level should have demonstrated:

- i knowledge of economic concepts, principles and tools
- ii knowledge of distinctive economic theories, interpretations and modelling approaches
- iii awareness of quantitative methods and computing techniques appropriate to their course of study, and show an appreciation of the contexts in which these techniques and methods are relevant
- iv knowledge of the sources and content of economic data and evidence and appreciate what methods might be appropriately applied to the analysis of such data
- v know how to apply economic reasoning to policy issues
- vi knowledge and awareness of historical, political, institutional, international, social and environmental contexts in which specific economic analysis is applied
- vii knowledge in an appropriate number of specialised areas in economics
- viii awareness of the possibility that many economic problems may admit of more than one approach.

The typical level

7.3 A graduate in economics who has attained the typical level should have demonstrated:

- i understanding of economic concepts, principles and tools
- ii understanding of distinctive economic theories, interpretations and modelling approaches, and their competent use
- iii proficiency in quantitative methods and computing techniques and know how to use these techniques and methods effectively across a range of problems
- iv understanding of the sources and content of economic data and evidence and of those methods that might be applied appropriately to the analysis of such data
- v knowledge of how to apply economic reasoning to policy issues in a critical manner
- vi an understanding of the historical, political, institutional, international, social and environmental contexts in which specific economic analysis is applied
- vii knowledge in an appropriate number of specialised areas in economics, as well as an appreciation of the research literature in these areas
- viii familiarity with the possibility that many economic problems may admit of more than one approach.

Appendix: Membership of the benchmarking and review groups for the Subject Benchmark Statement for economics

Membership of the review group for the Subject Benchmark Statement for Economics (2019)

The fourth edition, published in 2019, was revised by QAA to align the content with the revised UK Quality Code for Higher Education, published in 2018. Proposed revisions were checked and verified by a member of the review group of the Subject Benchmark Statement for Economics from 2015.

Professor Wendy Carlin
Dr Andy Smith

University College London
